

COVID-19 Weekly Epidemiological Update

Edition 108 published 7 September 2022

In this edition:

- [Global overview](#)
- [Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern](#)
- [WHO regional overviews](#)

Global overview

Data as of 4 September 2022

Globally, the number of new weekly cases decreased by 12% during the week of 29 August to 4 September 2022, as compared to the previous week, with just under 4.2 million new cases reported (Figure 1, Table 1). The number of new weekly deaths decreased by 5% as compared to the previous week, with over 13 700 reported. Globally, as of 4 September 2022, over 600 million confirmed cases and over 6.4 million deaths have been reported.

At the regional level, the number of newly reported weekly cases decreased across all six regions: the Eastern Mediterranean Region (-29%), the South-East Asia Region (-22%), the European Region (-15%), the African Region (-10%), the Western Pacific Region (-10%) and the Region of the Americas (-9%). The number of new weekly deaths decreased across three of the six regions: the South-East Asia Region (-24%), the European Region (-22%) and the Eastern Mediterranean Region (-12%); while it increased in the African Region (+14%), the Region of the Americas (+6%) and the Western Pacific Region (+5%).

Figure 1. COVID-19 cases reported weekly by WHO Region, and global deaths, as of 4 September 2022**

**See [Annex 1: Data, table, and figure notes](#)

At the country level, the highest numbers of new weekly cases were reported from Japan (1 164 787 new cases; -7%), the United States of America (586 509 new cases; +2%), the Republic of Korea (585 374 new cases; -21%), the Russian Federation (323 500 new cases; +12%) and China (238 044 new cases; +22%). The highest numbers of new weekly deaths were reported from the United States of America (3558 new deaths; +26%), Japan (2059 new deaths; +3%), Brazil (865 new deaths; -17%), the Russian Federation (628 new deaths; +20%) and the Republic of Korea (524 new deaths; similar to the previous week).

Current trends in reported COVID-19 cases and deaths should be interpreted with caution as several countries have been progressively changing COVID-19 testing strategies, resulting in lower overall numbers of tests performed and consequently lower numbers of cases detected. Additionally, data from countries are continuously updated by WHO to incorporate changes in reported COVID-19 cases and deaths made by countries retrospectively.

Table 1. Newly reported and cumulative COVID-19 confirmed cases and deaths, by WHO Region, as of 4 September 2022**

WHO Region	New cases in last 7 days (%)	Change in new cases in last 7 days *	Cumulative cases (%)	New deaths in last 7 days (%)	Change in new deaths in last 7 days *	Cumulative deaths (%)
Western Pacific	2 149 463 (51%)	-10%	85 188 760 (14%)	3 707 (27%)	5%	261 895 (4%)
Europe	1 092 799 (26%)	-15%	246 634 859 (41%)	3 355 (24%)	-22%	2 061 081 (32%)
Americas	821 450 (20%)	-9%	176 211 601 (29%)	5 645 (41%)	6%	2 820 836 (44%)
South-East Asia	90 523 (2%)	-22%	60 053 325 (10%)	602 (4%)	-24%	795 991 (12%)
Eastern Mediterranean	33 697 (1%)	-29%	22 994 621 (4%)	357 (3%)	-12%	347 656 (5%)
Africa	11 420 (<1%)	-10%	9 297 294 (2%)	50 (<1%)	14%	174 344 (3%)
Global	4 199 352 (100%)	-12%	600 381 224 (100%)	13 716 (100%)	-5%	6 461 816 (100%)

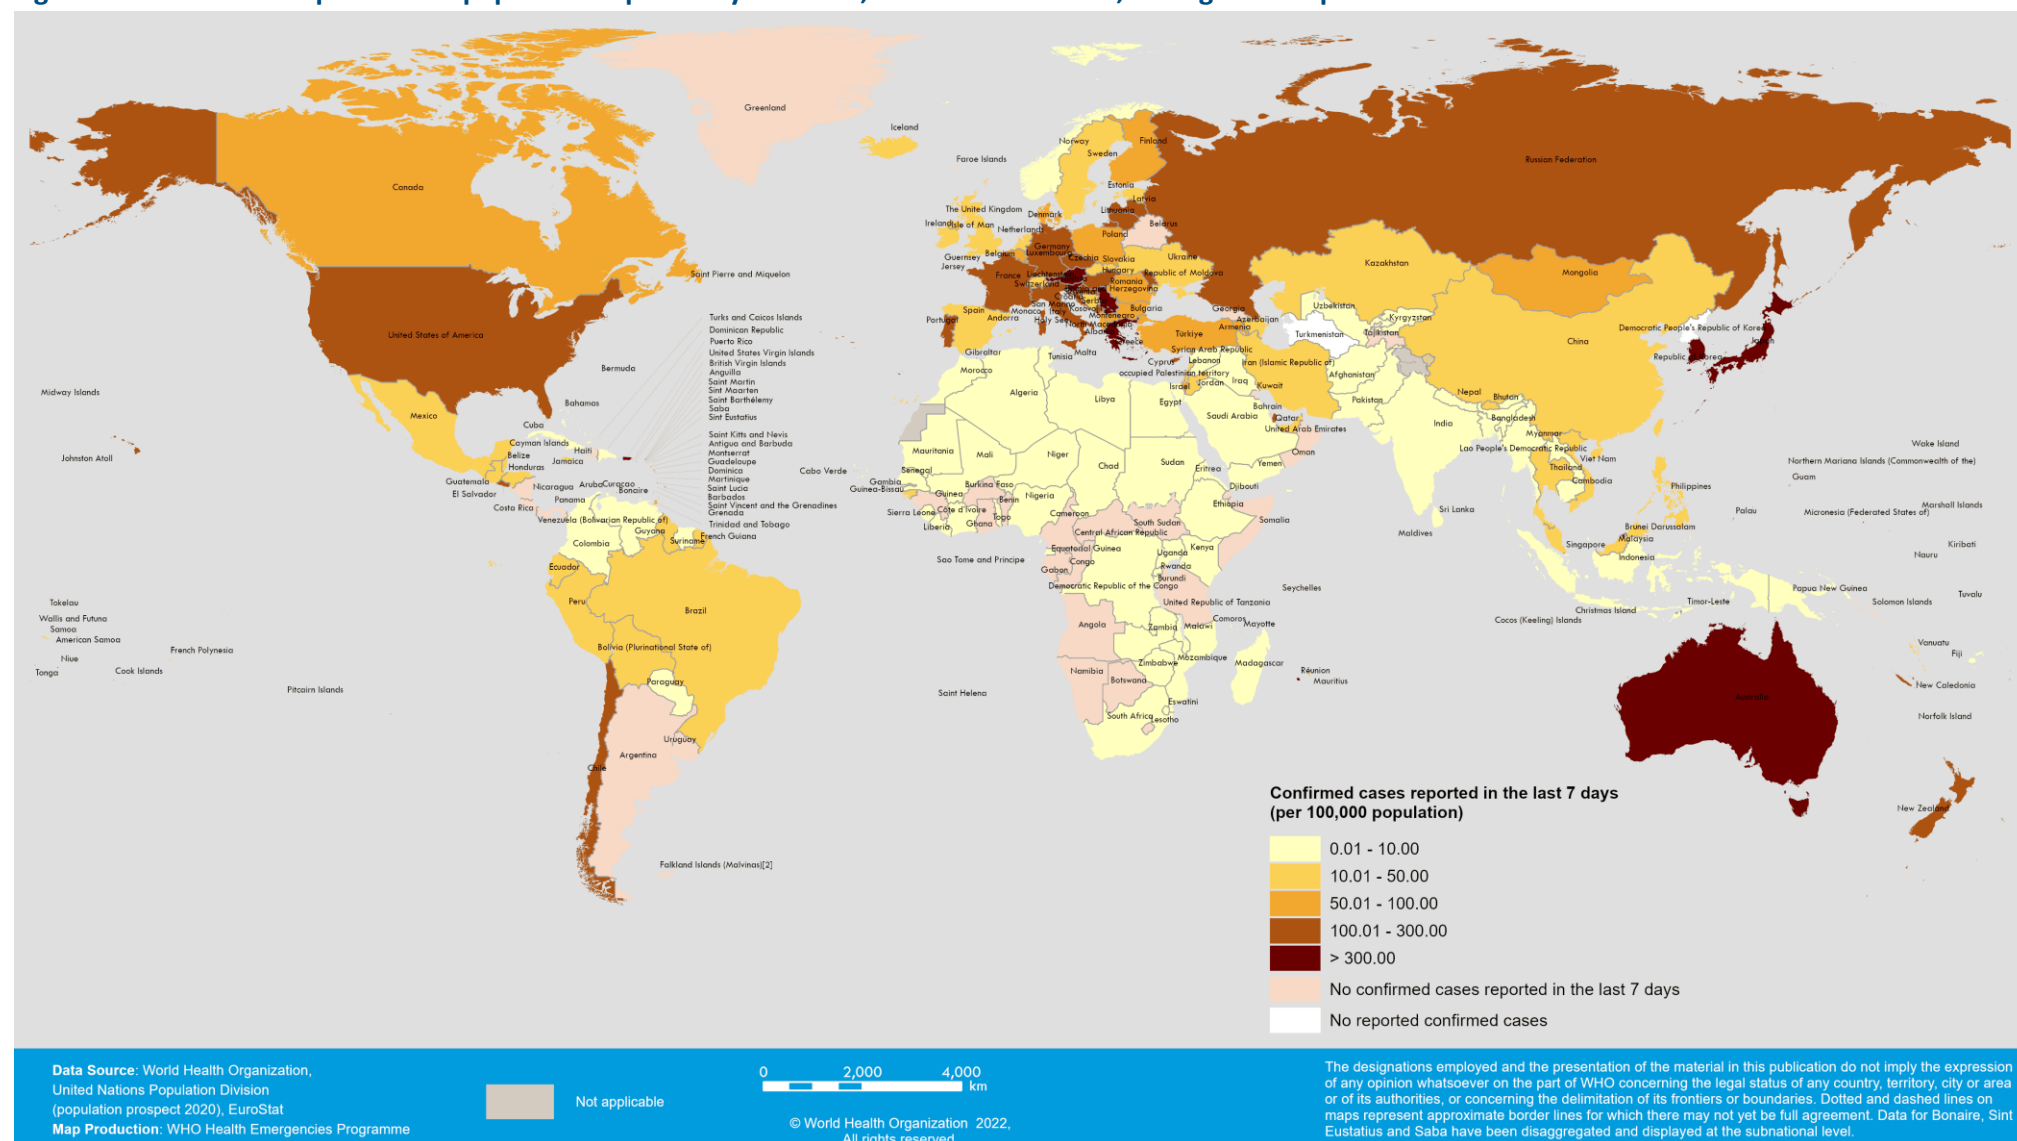

*Percent change in the number of newly confirmed cases/deaths in the past seven days, compared to seven days prior. Data from previous weeks are updated continuously with adjustments received from countries.

Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern

Geographic spread and prevalence of VOCs

Globally, from 5 August to 5 September 2022, 118 028 SARS-CoV-2 sequences were shared through GISAID. Among these, 117 317 sequences were the Omicron variant of concern (VOC), accounting for 99.4% of sequences reported globally in the past 30 days.

A comparison of sequences submitted to GISAID in epidemiological week 34 (22 to 28 August 2022) and week 33 (15 to 21 August 2022) shows that BA.5 Omicron descendent lineages continue to be dominant globally, with an increase in weekly prevalence from 84.8% to 86.8%. The prevalence of BA.4 descendent lineages decreased from 6.8% in week 33 to 4.2% in week 34 including BA.4.6 descendent lineage, which decreased from 3.5% to 2% within the same time period. The prevalence of BA.2 descendent lineages (BA.2.X) remained stable in week 34 compared to week 33 (2.6% in week 33 and 2.5% in week 34). BA.2.75, an Omicron descendent lineage under monitoring, still shows a relatively low (0.9% and 1.2% in weeks 33 and 34 respectively) prevalence globally, but a number of countries have observed recent increasing trends.

WHO continues to monitor all lineages, including descendent lineages of VOCs, to track any increase in prevalence and change in viral characteristics. The current trends describing the circulation of Omicron descendent lineages should be interpreted with due consideration of the limitations of the SARS-CoV-2 surveillance systems. These include differences in sequencing capacity and sampling strategies between countries, changes in sampling strategies, reductions in tests conducted and sequences shared by countries around the world and delays in uploading sequence data to GISAID.

For more information on the assessment of SARS-CoV-2 variants and the WHO classification refer to Annex 2.

WHO regional overviews:

Epidemiological week 29 August - 4 September 2022**

African Region

The African Region reported over 11 000 new weekly cases, a 10% decrease compared to the previous week. Eight (16%) countries reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases seen in Mali (262 vs 55 new cases; +376%), Chad (47 vs 33 new cases; +42%) and Côte d'Ivoire (202 vs 166 new cases; +22%). The highest numbers of new cases were reported from Réunion (7014 new cases; 783.4 new cases per 100 000 population; +23%), South Africa (1275 new cases; 2.1 new cases per 100 000; -14%) and Nigeria (460 new cases; <1 new case per 100 000; -7%).

The number of new weekly deaths in the Region increased by 14% as compared to the previous week, with 50 deaths reported. The highest numbers of new deaths were reported from South Africa (24 new deaths; <1 new death per 100 000 population; +33%), Réunion (13 new deaths; 1.5 new deaths per 100 000; +117%), and the Democratic Republic of the Congo (four new deaths; <1 new death per 100 000; -20%).

Updates from the [African Region](#)

Region of the Americas

The Region of the Americas reported over 821 000 new cases, a 9% decrease as compared to the previous week. Four of 56 (7%) countries for which data are available reported increases in the number of new cases of 20% or greater, with the greatest proportional increases observed in Sint Eustatius (15 vs eight new cases; +88%), United States Virgin Islands (264 vs 181 new cases; +46%) and Mexico (22 111 vs 17 325 new cases; +28%). The highest numbers of new cases were reported from the United States of America (586 509 new cases; 177.2 new cases per 100 000; +2%), Brazil (87 236 new cases; 41.0 new cases per 100 000; -17%) and Chile (40 080 new cases; 209.7 new cases per 100 000; -27%).

The number of new weekly deaths reported in the Region increased by 6% as compared to the previous week, with over 5600 deaths reported. The highest numbers of new deaths were reported from the United States of America (3558 new deaths; 1.1 new deaths per 100 000; +26%), Brazil (865 new deaths; <1 new death per 100 000; -17%) and Canada (288 new deaths; <1 new death per 100 000; -1%).

Updates from the [Region of the Americas](#)

Eastern Mediterranean Region

The Eastern Mediterranean Region reported over 33 000 new cases, a 29% decrease as compared to the previous week. No countries in the Region reported an increase in the number of new cases of 20% or greater compared to the previous week. The highest numbers of new cases were reported from the Islamic Republic of Iran (11 351 new cases; 13.5 new cases per 100 000; -27%), Jordan (3946 new cases; 38.7 new cases per 100 000; -18%) and Qatar (3944 new cases; 136.9 new cases per 100 000; +2%).

The number of new weekly deaths decreased in the Region by 12% as compared to the previous week, with over 350 new deaths reported. The highest numbers of new deaths were reported from the Islamic Republic of Iran (282 new deaths; <1 new death per 100 000; +1%), Lebanon (17 new deaths; <1 new death per 100 000; -15%), and Pakistan (17 new deaths; <1 new death per 100 000; -19%).

Updates from the [Eastern Mediterranean Region](#)

European Region

The European Region reported just under 1.1 million new cases, a 15% decrease as compared to the previous week. Two (3%) countries reported increases in new cases of 20% or greater, with the highest proportional increases observed in Gibraltar (20 vs 15 new cases; +33%) and Ukraine (11 437 vs 9113 new cases; +26%). The highest numbers of new cases were reported from the Russian Federation (323 500 new cases; 221.7 new cases per 100 000; +12%), Germany (183 715 new cases; 220.9 new cases per 100 000; -19%) and Italy (136 211 new cases; 228.4 new cases per 100 000; -14%).

Over 3300 new weekly deaths were reported in the Region, a 22% decrease as compared to the previous week. The highest numbers of new deaths were reported from the Russian Federation (628 new deaths; <1 new death per 100 000; +20%), Italy (496 new deaths; <1 new death per 100 000; -23%) and Spain (350 new deaths; <1 new death per 100 000; +7%).

Updates from the [European Region](#)

South-East Asia Region

The South-East Asia Region reported over 90 000 new cases, a 22% decrease as compared to the previous week. One of the 10 countries (10%) in the Region for which data are available showed an increase in the number of new cases of 20% or greater: Myanmar (597 vs 308 new cases; +94%). The highest numbers of new cases were reported from India (48 403 new cases; 3.5 new cases per 100 000; -30%), Indonesia (26 238 new cases; 9.6 new cases per 100 000; -15%) and Thailand (12 130 new cases; 17.4 new cases per 100 000; -1%).

The Region reported just over 600 deaths, a 24% decrease compared to the previous week. The highest numbers of new deaths were reported from India (237 new deaths; <1 new death per 100 000; -44%), Thailand (178 new deaths; <1 new death per 100 000; -9%) and Indonesia (147 new deaths; <1 new death per 100 000; +20%).

Updates from the [South-East Asia Region](#)

Western Pacific Region

The Western Pacific Region reported just over 2.1 million new cases, a 10% decrease compared to the previous week. However, three (9%) countries reported increases in new cases of 20% or greater, with some of the largest proportional increases observed in Vanuatu (83 vs 10 new cases; +730%) and Micronesia (Federated States of) (1486 vs 182 new cases; +716%). The highest numbers of new cases were reported from Japan (1 164 787 new cases; 921.0 new cases per 100 000; -7%), the Republic of Korea (585 374 new cases; 1141.8 new cases per 100 000; -21%) and China (238 044 new cases; 16.2 new cases per 100 000; +22%).

The Region reported a 5% increase in new weekly deaths compared to the previous week, with over 3700 deaths reported. The highest numbers of new deaths were reported from Japan (2059 new deaths; 1.6 new deaths per 100 000; +3%), the Republic of Korea (524 new deaths; 1.0 new deaths per 100 000; similar to the previous week) and Australia (366 new deaths; 1.4 new deaths per 100 000; -13%).

Updates from the [Western Pacific Region](#)

Annex 1. Data, table, and figure notes

Data presented are based on official laboratory-confirmed COVID-19 cases and deaths reported to WHO by country/territories/areas, largely based upon WHO [case definitions](#) and [surveillance guidance](#). While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change, and caution must be taken when interpreting these data as several factors influence the counts presented, with variable underestimation of true case and death incidences, and variable delays to reflecting these data at the global level. Case detection, inclusion criteria, testing strategies, reporting practices, and data cut-off and lag times differ between countries/territories/areas. A small number of countries/territories/areas report combined probable and laboratory-confirmed cases. Differences are to be expected between information products published by WHO, national public health authorities, and other sources.

A record of historic data adjustment made is available upon request by emailing epi-data-support@who.int. Please specify the countries of interest, time period, and purpose of the request/intended usage. Prior situation reports will not be edited; see covid19.who.int for the most up-to-date data. COVID-19 confirmed cases and deaths reported in the last seven days by countries, territories, and areas, and WHO Region (reported in previous issues) are now available at: <https://covid19.who.int/table>.

‘Countries’ may refer to countries, territories, areas or other jurisdictions of similar status. The designations employed, and the presentation of these materials do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement. Countries, territories, and areas are arranged under the administering WHO region. The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions except, the names of proprietary products are distinguished by initial capital letters.

^[1] All references to Kosovo should be understood to be in the context of the United Nations Security Council resolution 1244 (1999). In the map, the number of cases of Serbia and Kosovo (UNSCR 1244, 1999) have been aggregated for visualization purposes.

^[2] A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Updates on the COVID-19 outbreak in the Democratic People’s Republic of Korea is not included in this report as the number of laboratory-confirmed COVID-19 cases is not reported.

Annex 2. SARS-CoV-2 variants assessment and classification

WHO, in collaboration with national authorities, institutions and researchers, routinely assesses if variants of SARS-CoV-2 alter transmission or disease characteristics, or impact the effectiveness of vaccines, therapeutics, diagnostics or public health and social measures (PHSM) applied to control disease spread. Potential variants of concern (VOCs), variants of interest (VOIs) or variants under monitoring (VUMs) are regularly assessed based on the risk posed to global public health.

The classifications of variants will be revised as needed to reflect the continuous evolution of circulating variants and their changing epidemiology. Criteria for variant classification, and the lists of currently circulating and previously circulating VOCs, VOIs and VUMs, are available on the [WHO Tracking SARS-CoV-2 variants website](#). National authorities may choose to designate other variants and are strongly encouraged to investigate and report newly emerging variants and their impact.

COVID-19 Weekly Epidemiological Update

Edition 109 published 14 September 2022

In this edition:

- [Global overview](#)
- [Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern](#)
- [WHO regional overviews](#)

Global overview

Data as of 11 September 2022

Globally, the number of new weekly cases decreased by 28% during the week of 5 to 11 September 2022, as compared to the previous week, with over 3.1 million new cases reported (Figure 1, Table 1). The number of new weekly deaths decreased by 22% as compared to the previous week, with just under 11 000 fatalities reported. As of 11 September 2022, over 605 million confirmed cases and over 6.4 million deaths have been reported globally.

At the regional level, the number of newly reported weekly cases decreased across all six WHO regions: the Western Pacific Region (-36%), the African Region (-33%), the Region of the Americas (-27%), the South-East Asia Region (-20%), the Eastern Mediterranean Region (-19%) and the European Region (-15%). The number of new weekly deaths decreased across five of the six regions: the European Region (-31%), the South-East Asia Region (-25%), the Region of the Americas (-22%), the Western Pacific Region (-11%), the Eastern Mediterranean Region (-10%); while it increased in the African Region (+10%).

Figure 1. COVID-19 cases reported weekly by WHO Region, and global deaths, as of 11 September 2022**

**See [Annex 1: Data, table, and figure notes](#)

At the country level, the highest numbers of new weekly cases were reported from Japan (537 181 new cases; -54%), the Republic of Korea (435 695 new cases; -26%), the United States of America (430 048 new cases; -26%), the Russian Federation (337 187 new cases; +4%) and China (263 288 new cases; +11%). The highest numbers of new weekly deaths were reported from the United States of America (2306 new deaths; -21%), Japan (1681 new deaths; -18%), the Russian Federation (637 new deaths; +1%), Brazil (551 new deaths; -36%) and the Philippines (440 new deaths; +28%).

Current trends in reported COVID-19 cases and deaths should be interpreted with caution as several countries have been progressively changing COVID-19 testing strategies, resulting in lower overall numbers of tests performed and consequently lower numbers of cases detected. Additionally, data from previous weeks are continuously updated to retrospectively incorporate changes in reported COVID-19 cases and deaths made by countries.

Table 1. Newly reported and cumulative COVID-19 confirmed cases and deaths, by WHO Region, as of 11 September 2022**

WHO Region	New cases in last 7 days (%)	Change in new cases in last 7 days *	Cumulative cases (%)	New deaths in last 7 days (%)	Change in new deaths in last 7 days *	Cumulative deaths (%)
Western Pacific	1 374 533 (44%)	-36%	86 563 513 (14%)	3 289 (30%)	-11%	265 184 (4%)
Europe	1 037 111 (33%)	-15%	249 801 915 (41%)	2 817 (26%)	-31%	2 083 723 (32%)
Americas	610 303 (19%)	-27%	176 886 543 (29%)	3 998 (37%)	-22%	2 825 662 (44%)
South-East Asia	72 601 (2%)	-20%	60 125 926 (10%)	453 (4%)	-25%	796 444 (12%)
Eastern Mediterranean	27 586 (1%)	-19%	23 022 557 (4%)	321 (3%)	-10%	347 977 (5%)
Africa	8 841 (<1%)	-33%	9 308 479 (2%)	57 (1%)	10%	174 404 (3%)
Global	3 130 975 (100%)	-28%	605 709 697 (100%)	10 935 (100%)	-22%	6 493 407 (100%)

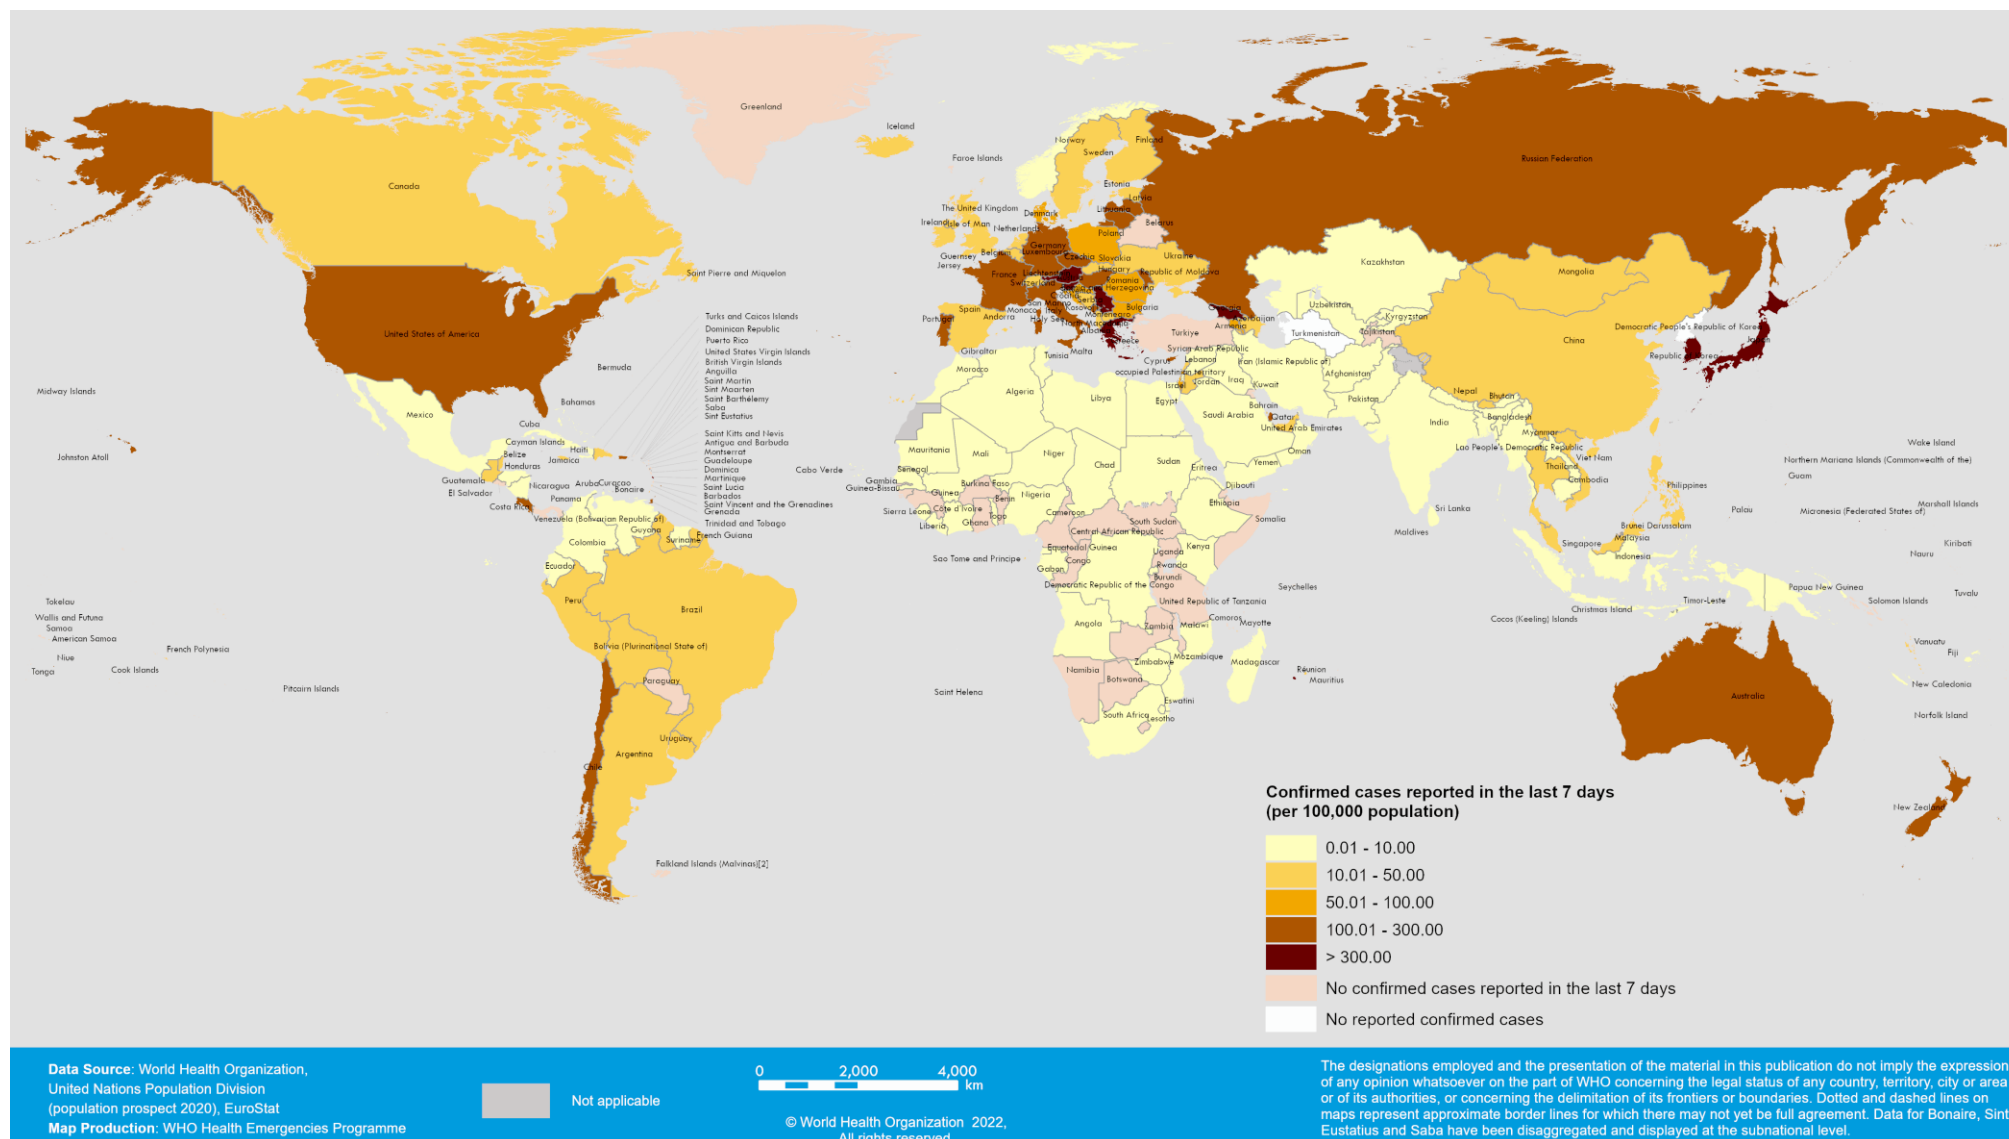

*Percent change in the number of newly confirmed cases/deaths in the past seven days, compared to seven days prior. Data from previous weeks are updated continuously with adjustments received from countries.

Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern

Geographic spread and prevalence of VOCs

Globally, from 12 August to 12 September 2022, 123 400 SARS-CoV-2 sequences were shared through GISAID. Among these, 122 374 sequences were the Omicron variant of concern (VOC), accounting for 99.2% of sequences reported globally in the past 30 days.

A comparison of sequences submitted to GISAID in epidemiological week 35 (29 August to 4 September 2022) and week 34 (22 to 28 August 2022) shows that BA.5 Omicron descendent lineages continue to be dominant globally, with an increase in weekly prevalence from 82.4% to 90.0%. The prevalence of BA.4 descendent lineages (including BA.4.6) decreased from 8.0% in week 34 to 6.1% in week 35. The prevalence of BA.2 descendent lineages (BA.2.X) increased in week 35 compared to week 34 (2.3% in week 34 and 3.2% in week 35). BA.2.75 is an Omicron descendent lineage under monitoring that continues to show low prevalence globally (1.0% and 2.2% in weeks 34 and 35 respectively).

WHO continues to monitor SARS-CoV-2 variants, including descendent lineages of VOCs, to track changes in prevalence and viral characteristics. The current trends describing the circulation of Omicron descendent lineages should be interpreted with due consideration of the limitations of the COVID-19 surveillance systems. These include differences in sequencing capacity and sampling strategies between countries, changes in sampling strategies over time, reductions in tests conducted and sequences shared by countries around the world and delays in uploading sequence data to GISAID.

For more information on the assessment of SARS-CoV-2 variants and the WHO classification, refer to Annex 2.

WHO regional overviews:

Epidemiological week 5 - 11 September 2022**

African Region

The African Region reported over 8800 new weekly cases, a 33% decrease as compared to the previous week. Nine (18%) countries reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases seen in Mali (629 vs 262 new cases; +140%), Liberia (31 vs 15 new cases; +107%) and Zimbabwe (115 vs 56 new cases; +105%). The highest numbers of new cases were reported from Réunion (4661 new cases; 520.6 new cases per 100 000 population; -34%), South Africa (1792 new cases; 3.0 new cases per 100 000; +41%) and Mali (629 new cases; 3.1 new cases per 100 000; +140%).

The number of new weekly deaths in the Region increased by 10% as compared to the previous week, with 57 deaths reported. The highest numbers of new deaths were reported from South Africa (21 new deaths; <1 new death per 100 000 population; -13%), the Democratic Republic of the Congo (17 new deaths; <1 new death per 100 000; +325%) and Nigeria (six new deaths; <1 new death per 100 000; no deaths reported during the previous week).

Updates from the [African Region](#)

Region of the Americas

The Region of the Americas reported over 610 000 new cases, a 27% decrease as compared to the previous week. Five of 56 (9%) countries for which data are available reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases observed in Montserrat (86 vs 64 new cases; +34%), Venezuela (Bolivarian Republic of) (890 vs 665 new cases; +34%) and Aruba (122 vs 98 new cases; +24%). The highest numbers of new cases were reported from the United States of America (430 048 new cases; 129.9 new cases per 100 000; -26%), Brazil (60 594 new cases; 28.5 new cases per 100 000; -31%) and Chile (32 268 new cases; 168.8 new cases per 100 000; -19%).

The number of new weekly deaths reported in the Region decreased by 22% as compared to the previous week, with just under 4000 new deaths reported. The highest numbers of new deaths were reported from the United States of America (2306 new deaths; <1 new death per 100 000; -21%), Brazil (551 new deaths; <1 new death per 100 000; -36%) and Peru (255 new deaths; <1 new death per 100 000; +9%).

Updates from the [Region of the Americas](#)

Eastern Mediterranean Region

The Eastern Mediterranean Region reported over 27 000 new cases, a 19% decrease as compared to the previous week. Three (14%) countries reported increases in new cases of 20% or greater, with the highest proportional increases observed in Yemen (six vs one new cases; +500%), Sudan (23 vs 14 new cases; +64%) and Tunisia (962 vs 695 new cases; +38%). The highest numbers of new cases were reported from the Islamic Republic of Iran (7800 new cases; 9.3 new cases per 100 000; -31%), Qatar (4247 new cases; 147.4 new cases per 100 000; +8%) and Jordan (3372 new cases; 33.0 new cases per 100 000; -15%).

The number of new weekly deaths decreased in the Region by 10% as compared to the previous week, with over 300 new deaths reported. The highest numbers of new deaths were reported from the Islamic Republic of Iran (260 new deaths; <1 new death per 100 000; -8%), Saudi Arabia (13 new deaths; <1 new death per 100 000; similar to the previous week's figures) and Pakistan (11 new deaths; <1 new death per 100 000; -35%).

Updates from the [Eastern Mediterranean Region](#)

European Region

The European Region reported over 1 million new cases, a 15% decrease as compared to the previous week. Four (7%) countries reported increases in new cases of 20% or greater, with the highest proportional increases observed in Ukraine (16 155 vs 11 437 new cases; +41%), Slovenia (11 076 vs 8872 new cases; +25%) and Poland (25 133 vs 20 247 new cases; +24%). The highest numbers of new cases were reported from the Russian Federation (337 187 new cases; 231.1 new cases per 100 000; similar to the previous week's figures), Germany (183 874 new cases; 221.1 new cases per 100 000; -9%) and Italy (110 644 new cases; 185.5 new cases per 100 000; -19%).

Over 2800 new weekly deaths were reported in the Region, a 31% decrease as compared to the previous week. The highest numbers of new deaths were reported from the Russian Federation (637 new deaths; <1 new death per 100 000; similar to the previous week), Italy (373 new deaths; <1 new death per 100 000; -25%) and Spain (326 new deaths; <1 new death per 100 000; -7%).

Updates from the [European Region](#)

South-East Asia Region

The South-East Asia Region reported over 72 000 new cases, a 20% decrease as compared to the previous week. Three of the 10 countries (30%) in the Region for which data are available showed an increase in the number of new cases of 20% or greater: Myanmar (1293 vs 597 new cases; +117%), Bangladesh (2126 vs 1444 new cases; +47%) and Timor-Leste (33 vs 25; +32%). The highest numbers of new cases were reported from India (38 824 new cases; 2.8 new cases per 100 000; -20%), Indonesia (19 950 new cases; 7.3 new cases per 100 000; -24%) and Thailand (9004 new cases; 12.9 new cases per 100 000; -26%).

The Region reported over 400 deaths, a 25% decrease as compared to the previous week. The highest numbers of new deaths were reported from India (159 new deaths; <1 new death per 100 000; -33%), Thailand (139 new deaths; <1 new death per 100 000; -22%) and Indonesia (123 new deaths; <1 new death per 100 000; -16%).

Updates from the [South-East Asia Region](#)

Western Pacific Region

The Western Pacific Region reported just over 1.3 million new cases, a 36% decrease as compared to the previous week. Two (6%) countries reported increases in new cases of 20% or greater, with the largest proportional increases observed in Papua New Guinea (20 vs 15 new cases; +33%) and Viet Nam (20 467 vs 15 906 new cases; +29%). The highest numbers of new cases were reported from Japan (537 181 new cases; 424.7 new cases per 100 000; -54%), the Republic of Korea (435 695 new cases; 849.8 new cases per 100 000; -26%) and China (263 288 new cases; 17.9 new cases per 100 000; +11%).

The Region reported an 11% decrease in new weekly deaths as compared to the previous week, with over 3200 deaths reported. The highest numbers of new deaths were reported from Japan (1681 new deaths; 1.3 new deaths per 100 000; -18%), the Philippines (440 new deaths; <1 new death per 100 000; +28%) and Australia (407 new deaths; 1.6 new deaths per 100 000; +11%).

Updates from the [Western Pacific Region](#)

Annex 1. Data, table, and figure notes

Data presented are based on official laboratory-confirmed COVID-19 cases and deaths reported to WHO by country/territories/areas, largely based upon WHO [case definitions](#) and [surveillance guidance](#). While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change, and caution must be taken when interpreting these data as several factors influence the counts presented, with variable underestimation of true case and death incidences, and variable delays to reflecting these data at the global level. Case detection, inclusion criteria, testing strategies, reporting practices, and data cut-off and lag times differ between countries/territories/areas. A small number of countries/territories/areas report combined probable and laboratory-confirmed cases. Differences are to be expected between information products published by WHO, national public health authorities, and other sources.

A record of historic data adjustment made is available upon request by emailing epi-data-support@who.int. Please specify the countries of interest, time period, and purpose of the request/intended usage. Prior situation reports will not be edited; see covid19.who.int for the most up-to-date data. COVID-19 confirmed cases and deaths reported in the last seven days by countries, territories, and areas, and WHO Region (reported in previous issues) are now available at: <https://covid19.who.int/table>.

‘Countries’ may refer to countries, territories, areas or other jurisdictions of similar status. The designations employed, and the presentation of these materials do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement. Countries, territories, and areas are arranged under the administering WHO region. The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions except, the names of proprietary products are distinguished by initial capital letters.

^[1] All references to Kosovo should be understood to be in the context of the United Nations Security Council resolution 1244 (1999). In the map, the number of cases of Serbia and Kosovo (UNSCR 1244, 1999) have been aggregated for visualization purposes.

^[2] A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Updates on the COVID-19 outbreak in the Democratic People’s Republic of Korea is not included in this report as the number of laboratory-confirmed COVID-19 cases is not reported.

Annex 2. SARS-CoV-2 variants assessment and classification

WHO, in collaboration with national authorities, institutions and researchers, routinely assesses if variants of SARS-CoV-2 alter transmission or disease characteristics, or impact the effectiveness of vaccines, therapeutics, diagnostics or public health and social measures (PHSM) applied to control disease spread. Potential variants of concern (VOCs), variants of interest (VOIs) or variants under monitoring (VUMs) are regularly assessed based on the risk posed to global public health.

The classifications of variants will be revised as needed to reflect the continuous evolution of circulating variants and their changing epidemiology. Criteria for variant classification, and the lists of currently circulating and previously circulating VOCs, VOIs and VUMs, are available on the [WHO Tracking SARS-CoV-2 variants website](#). National authorities may choose to designate other variants and are strongly encouraged to investigate and report newly emerging variants and their impact.

COVID-19 Weekly Epidemiological Update

Edition 110 published 21 September 2022

In this edition:

- [Global overview](#)
- [Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern](#)
- [WHO regional overviews](#)

Global overview

Data as of 18 September 2022

Globally, the number of new weekly cases remained stable during the week of 12 to 18 September 2022 as compared to the previous week, with over 3.2 million new cases reported (Figure 1, Table 1). The number of new weekly deaths decreased by 17% as compared to the previous week, with over 9800 fatalities reported. As of 18 September 2022, over 609 million confirmed cases and over 6.5 million deaths have been reported globally.

At the regional level, the number of newly reported weekly cases decreased or remained stable across all six WHO regions: the African Region (-35%), the Eastern Mediterranean Region (-14%), the Region of the Americas (-12%), the South-East Asia Region (-8%), the European Region (-1%) and the Western Pacific Region (+3%). The number of new weekly deaths decreased across all six regions: the Eastern Mediterranean Region (-46%), the African Region (-27%), the Western Pacific Region (-27%), the European Region (-22%), the South-East Asia Region (-6%) and the Region of the Americas (-5%).

Figure 1. COVID-19 cases reported weekly by WHO Region, and global deaths, as of 18 September 2022**

**See [Annex 1: Data, table, and figure notes](#)

At the country level, the highest numbers of new weekly cases were reported from Japan (605 919 new cases; +13%), the United States of America (395 117 new cases; -11%), the Republic of Korea (389 579 new cases; -11%), the Russian Federation (372 485 new cases; +10%) and China (297 693 new cases; 13%). The highest numbers of new weekly deaths were reported from the United States of America (2601 new deaths; +5%), Japan (1162 new deaths; -31%), the Russian Federation (697 new deaths; +9%), Spain (595 new deaths; +83%) and Brazil (487 new deaths; -12%).

Current trends in reported COVID-19 cases and deaths should be interpreted with caution as several countries have been progressively changing COVID-19 testing strategies, resulting in lower overall numbers of tests performed and consequently lower numbers of cases detected. Additionally, data from previous weeks are continuously updated to retrospectively incorporate changes in reported COVID-19 cases and deaths made by countries.

Table 1. Newly reported and cumulative COVID-19 confirmed cases and deaths, by WHO Region, as of 18 September 2022**

WHO Region	New cases in last 7 days (%)	Change in new cases in last 7 days *	Cumulative cases (%)	New deaths in last 7 days (%)	Change in new deaths in last 7 days *	Cumulative deaths (%)
Western Pacific	1 420 762 (44%)	3%	87 985 821 (14%)	2 415 (24%)	-27%	267 600 (4%)
Europe	1 164 233 (36%)	-1%	251 088 626 (41%)	2 767 (28%)	-22%	2 087 946 (32%)
Americas	552 342 (17%)	-12%	177 464 288 (29%)	4 037 (41%)	-5%	2 830 423 (44%)
South-East Asia	66 777 (2%)	-8%	60 192 703 (10%)	427 (4%)	-6%	796 871 (12%)
Eastern Mediterranean	23 658 (1%)	-14%	23 046 219 (4%)	172 (2%)	-46%	348 149 (5%)
Africa	6 853 (<1%)	-35%	9 317 547 (2%)	44 (<1%)	-27%	174 453 (3%)
Global	3 234 625 (100%)	-2%	609 095 968 (100%)	9 862 (100%)	-17%	6 505 455 (100%)

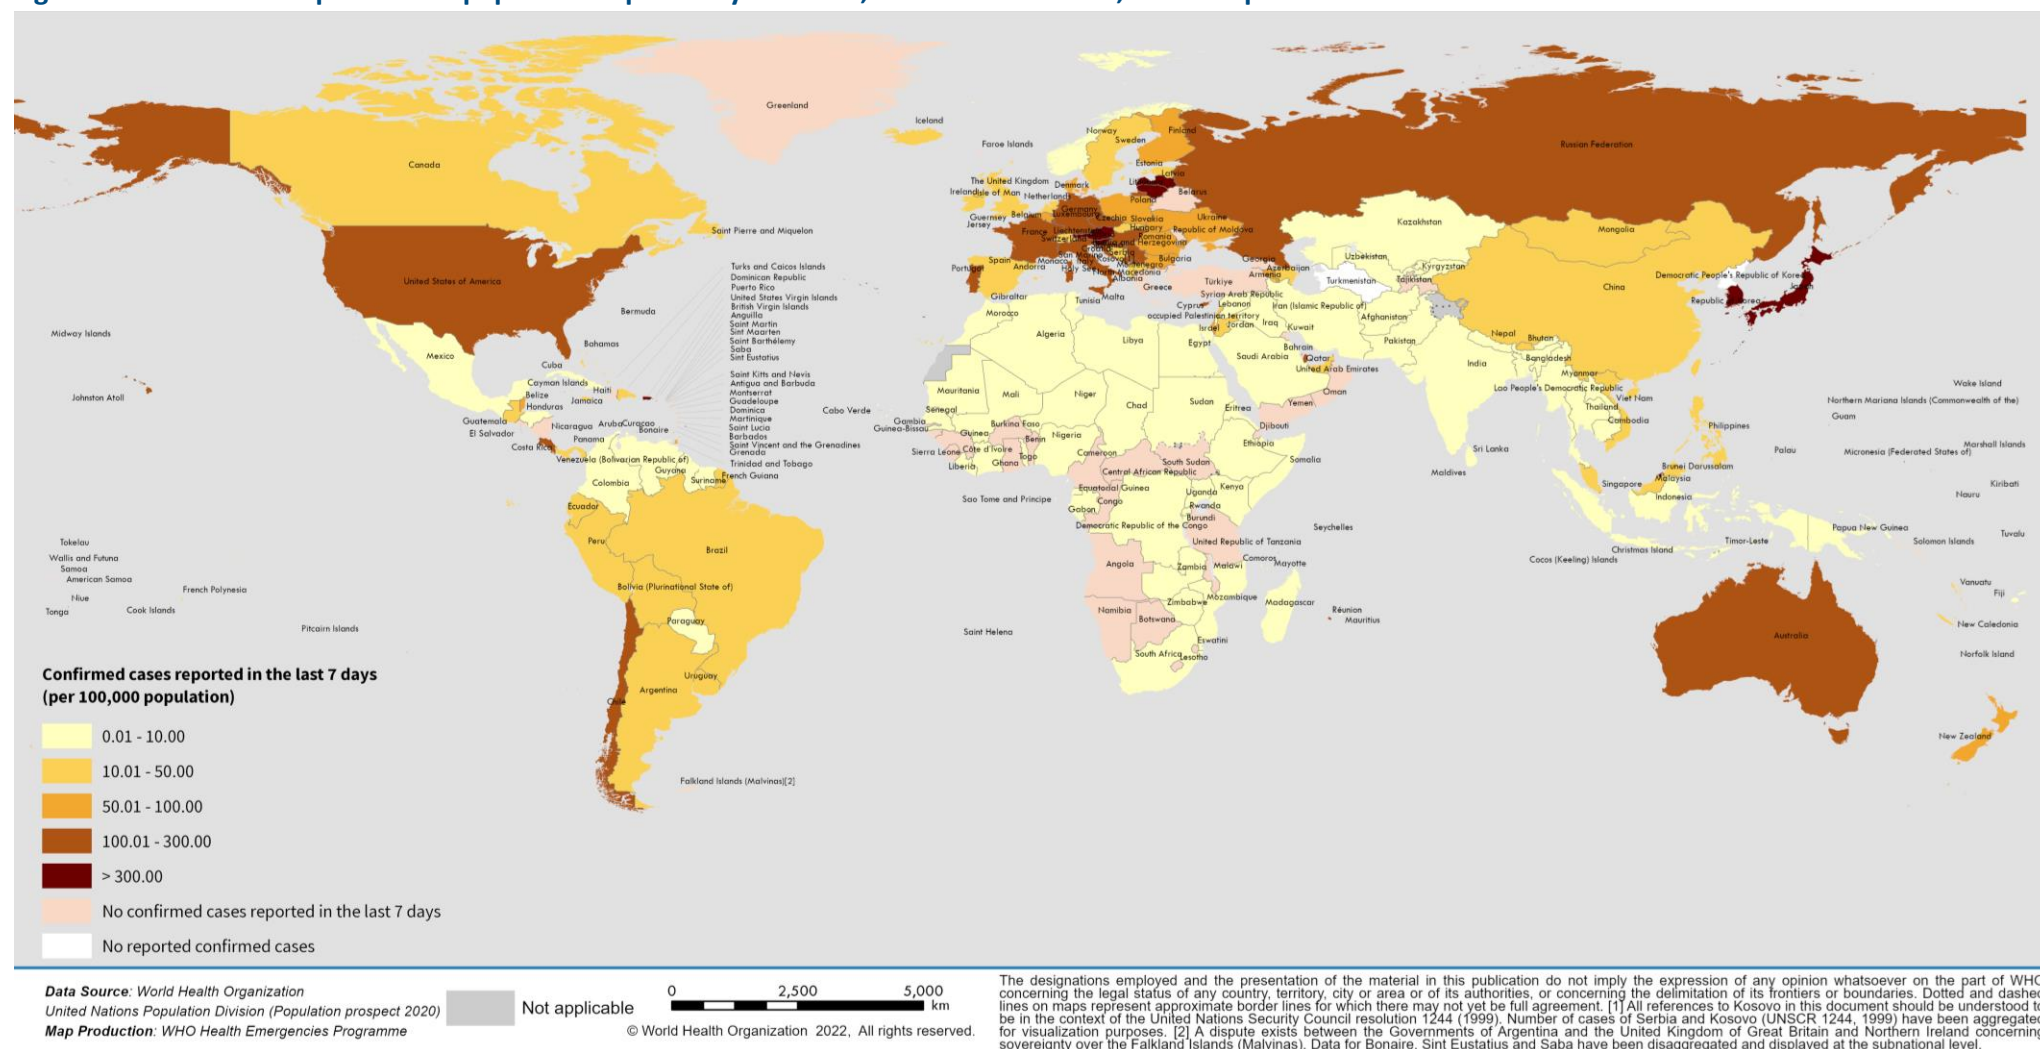

*Percent change in the number of newly confirmed cases/deaths in the past seven days, compared to seven days prior. Data from previous weeks are updated continuously with adjustments received from countries.

Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern

Geographic spread and prevalence of VOCs

Globally, from 19 August to 19 September 2022, 120 617 SARS-CoV-2 sequences were shared through GISAID. Among these, 119 458 sequences were of the Omicron variant of concern (VOC), accounting for 99.0% of sequences reported globally in the past 30 days. As the number of submitted sequences continues to decline, interpretation of trends should be made with due caution.

The current variant circulation is characterized by Omicron descendent lineages and by a large genetic diversification. More than 230 descendent lineages of Omicron, and more than 30 recombinants have emerged. These variants are being monitored and assessed by WHO based on criteria of genetic constellations of mutations, and/or indications of a rise in prevalence in a geographic location, as well as any evidence of phenotypic changes.ⁱ All of these lineages have different additional mutations, yet the majority do not warrant concern, either based on current knowledge of relevant genetic sites, or based on very low sequence circulation over several weeks. As of epidemiological week 35 (29 August to 4 September 2022), the pooled descendent lineages of BA.5 (BA.5.X) show the highest relative global prevalence of 76.6%, followed by BA.4.X with 7.5% prevalence. During the same period, BA.3.X, BA.2.X (excluding BA.2.75) and BA.1.X have declined in global prevalence to less than 1%.

Six lineages are currently classified as Omicron subvariants under monitoring. BA.2.75 is being monitored due to nine additional mutations in the spike as compared to its parent lineage BA.2; four of these mutations are within the receptor binding domain (RBD), and at least one of these RBD mutations has been associated with immune escape in previous variants.¹ Global prevalence of BA.2.75 is low (1.26% as of week 35), but has been rising over the last weeks. As of epidemiological week 35, a total of 48 countries have been reporting its detection; the majority of the reported sequences are from India. One of its descendent lineages, BA.2.75.2, has three additional spike mutations.

BA.5.1 + V445* (*indicating pooled amino acid substitutions), BA.5.2 + K444*, BA.5.2.1 + R346*, BA.5.2.1 + K444*, and BE.1.1 (BA.5.3.1.1.1) are emerging subvariants under monitoring, with mutations in RBD positions with predicted phenotypic effects (such as antibody escape, changes to ACE2 binding affinity, etc) and increased spread to new locations.ⁱⁱ The prevalence of these Omicron subvariants under monitoring is still low but rising over the last four weeks (see Table 2).

For more information on the assessment of SARS-CoV-2 variants and the WHO classification refer to Annex 2.

Table 3. Summary of phenotypic characteristics of the Omicron VOCⁱⁱⁱ

Public health domain of impact	Omicron (B.1.1.529)	Omicron sub lineages			
	Omicron (B.1.1.529)	BA.1	BA.2	BA.4	BA.5
Transmissibility	Growth advantage and increased transmissibility compared to Delta ²	Lower growth rate compared to BA.2, BA.4 and BA.5 ²	Lower growth rate compared to BA.4 and BA.5 ²	Lower growth advantage compared to BA.5 ²	Growth advantage compared to BA.1, BA.2 and BA.4 ²
Disease severity	Overall evidence suggests lower severity compared to Delta despite contrasting evidence. Earlier studies reported lower severity ³⁻⁸ . However, more recent studies report lower ⁹ or similar severity ¹⁰ .	There is evidence of higher disease severity compared to BA.4 and BA.5 ¹¹	There is evidence, both in favor of higher severity ¹¹ compared to BA.4 and BA.5 , as well as in support of similar disease severity compared to BA.4 and BA.5 ¹²	One preliminary study suggests lower severity compared to BA.1 and BA.2 ¹¹	There is one preliminary study suggesting increased severity compared to BA.1 and BA.2 ¹³ , while another study found lower disease severity compared to BA.1 and BA.2 ¹¹ . More evidence is needed.
Risk of reinfection	Reduced risk of Omicron reinfection among individuals previously infected with a different SARS-CoV-2 variant compared to naïve individuals ^{14,15}	Earlier studies reported reduced risk of reinfection with BA.1 after infection with BA.2 ¹⁴ . However, a recent study reported increased risk of reinfection following prior infection with any Omicron sub-lineage, as compared to non-Omicron VOCs ¹⁶ .	Reduced risk of reinfection following infection with BA.1 ¹⁴ However, a recent study reported increased risk of reinfection following prior infection with any Omicron sub-lineage, as compared to non-Omicron VOCs ¹⁶ .	Varying evidence regarding risk of reinfection. One study reported protection against infection following previous BA.2 infection ¹⁷ while a recent study reported increased risk of reinfection following prior infection with any Omicron sub-lineage, as compared to non-Omicron VOCs ¹⁶ .	Varying evidence regarding risk of reinfection. One study reported protection against infection following previous BA.2 infection ¹⁷ while a recent study reported increased risk of reinfection following prior infection with any Omicron sub-lineage, as compared to non-Omicron VOCs ¹⁶ .
Impact on antibody responses	Reduction in neutralizing activity reported as compared to other VOCs ¹⁸⁻²⁰	Lower neutralizing antibody titers compared to the index virus ²⁰	Lower neutralizing antibody titers compared to the index virus ²⁰	Lower neutralizing antibody titers compared to BA.1 ^{21,22}	Lower neutralizing antibody titres compared to BA.1 ²¹⁻²³
Impacts on diagnostics	PCR assays that include multiple gene targets maintain their accuracy to detect Omicron ²⁴ ; S gene target failure/positivity (SGTF) may be a proxy for screening. Limited to no impact on sensitivity of Ag-RDTs observed ²⁵⁻²⁸	S gene target failure	The majority will be S gene target positive	S gene target failure	S gene target failure
Impact on treatments	No difference in the effectiveness of antiviral agents (polymerase and protease inhibitors) against the Omicron variant ²⁹ . Conserved neutralizing activity for three broadly neutralizing monoclonal antibodies (sotrovimab, S2X259 and S2H97) and reduced effectiveness of other monoclonal antibodies ³⁰⁻³²	Reduced neutralization activity of sotrovimab and casirivimab-imdevimab ³³	Reduced neutralization activity of sotrovimab and casirivimab-imdevimab ³³	Reduced neutralization activity of sotrovimab and casirivimab-imdevimab ³³	Reduced neutralization activity of sotrovimab and casirivimab-imdevimab ³³
Impact on vaccination	Results of vaccine effectiveness (VE) studies should be interpreted with caution because estimates vary with the type of vaccine administered and the number of doses and scheduling (sequential administration of different vaccines). For further information, see the section Interpretation of the results of the VE for the Omicron variant				

ⁱⁱⁱ Studies contributing to the table are identified from an ongoing review of both the preprint and published literature on SARS-CoV-2 variants.

Figure 5. Vaccine effectiveness (VE) of primary series and first booster vaccination against the Omicron variant of concern

Dots represent point estimates of VE from each study; dark black horizontal lines represent median VE across all studies in stratum. All data is from a systematic review of COVID-19 VE studies; [methods](#) and [summary tables](#) of VE studies can be found on [view-hub.org](#). Vertical panels represent VE for full primary series (grey dots) and VE for homologous or heterologous booster vaccination (other colored dots) following completion of primary series vaccination with vaccine of primary series noted in column header. All booster VE estimates are for first booster dose. Severe disease includes hospitalization; symptomatic disease includes disease of any severity level; any infection can include symptomatic and asymptomatic infection. Not shown in plot: VE against severe disease at 0.5-<3 month post primary series of Beijing CNBG-BBIBP-CorV (59%, 95% CI: 4 to 80%) and Gamaleya-Gam-Covid Vac (64%, 95% CI: -45 to 92.2%). Additional details on the methods for inclusion of the estimates in the plots provided in text.

Figure 5 shows the absolute vaccine effectiveness (VE) over time against the Omicron variant, grouped by the primary series vaccine; booster doses may have been a different vaccine (i.e., both homologous and heterologous booster vaccination VEs are shown). Additional information on vaccine performance against VOCs can also be found in Annex 2.

Since the last [update on 17 August 2022](#), six new studies have been added to the figure. Two studies (not yet peer-reviewed) assessed the VE of mRNA vaccines (Pfizer BioNTech-Comirnaty and Moderna-mRNA-1273) against infection or symptomatic disease due to Omicron over time among children in the United Kingdom and Italy respectively.^{34,35} A third study assessed VE of two and three doses of Pfizer BioNTech-Comirnaty against hospitalization due to Omicron BA.1/BA.2 and due to Omicron BA.4./BA.5 among adults in South Africa.³⁶ A fourth study (not yet peer reviewed) assessed VE of three doses Pfizer BioNTech-Comirnaty against hospitalization due to Omicron among adults in the United Kingdom.³⁷ A fifth study (not yet peer reviewed) evaluated VE of primary series vaccination with Pfizer BioNTech-Comirnaty and Sinovac-CoronaVac against Omicron infection and symptomatic disease among persons five years and older in China (Hong Kong SAR).³⁸ A sixth study (not peer reviewed) provided new evidence on the VE of two doses of Pfizer BioNTech-Comirnaty and the VE of two doses of Gamaleya-Gam-Covid-Vac against hospitalization with severe acute respiratory infection with Omicron in patients 18 years and older in Paraguay.³⁹

Interpretation of the results of absolute VE for the Omicron variant for primary series and first booster dose vaccination

To date, 43 studies from 18 countries (Argentina, Brazil, Canada, Chile, Czech Republic, Denmark, Finland, China (Hong Kong SAR, Norway, Israel, Italy, Paraguay, Qatar, Singapore, South Africa, the United Kingdom, the United States of America, and Zambia) have collectively assessed the protection of seven vaccines against the Omicron variant (16 studies contributed VE estimates of primary series vaccination only to the plot, five contributed estimates of the first booster vaccination only, and 22 contributed to both). Findings from these studies show reduced VE of COVID-19 primary series vaccines against the Omicron variant for all outcomes (*severe disease*, *symptomatic disease*, and *infection*) compared to those that have been observed for the index SARS-CoV-2 strain and the other four VOCs (plots of VE against other VOCs can be found on the [VIEW-hub.org Resources Page](#)). Importantly though, VE estimates against the Omicron variant remain higher for *severe disease* than the other outcomes, in the majority of studies. The first booster vaccination substantially improves VE for all outcomes and for all combinations of schedules with estimates available for both primary series and booster vaccination. VE declines more in the first six months after the first booster vaccination for symptomatic disease and infection than it does for severe disease;⁴⁰ however, studies that assess VE of booster vaccination beyond six months are not yet available.

For *severe disease*, VE of the primary series showed little decline over six months. VE was $\geq 70\%$ during the first three months after primary series vaccination for 11 of 17 (65%) VE estimates for the mRNA vaccines (Moderna-Spikevax and Pfizer BioNTech-Comirnaty). Of the three vector vaccines studies available, all had VE $< 70\%$: two reported VE $< 70\%$ for AstraZeneca-Vaxzevria and Gamaleya-Gam-Covid-Vac, and the other reported VE $< 50\%$ for Janssen-Ad26.COV2.S. Four estimates were available for inactivated vaccines; none of the three estimates for Sinovac-CoronaVac were $\geq 70\%$ (2 [67%] were $\geq 50\%$). The single estimates for Beijing CNBG-BBIBP-CorV (Sinopharm) and for Gamaleya-Gam-Covid-Vac was $< 70\%$ but $\geq 50\%$ (data not shown in figure). Beyond three months after vaccination with the primary series, VE was $\geq 70\%$ for 14 of 38 (37%) VE estimates for the mRNA vaccines (25 [66%] had VE $\geq 50\%$); one of 13 (8%) AstraZeneca-Vaxzevria VE estimates was $\geq 70\%$ (10 [77%] were $\geq 50\%$); neither of the two estimates for a single dose of the other vector-based vaccine, Janssen-Ad26.COV2.S, was $\geq 50\%$; the four VE estimates for Sinovac-CoronaVac were $\geq 50\%$ but $< 70\%$.

The first booster dose vaccination improved VE against *severe disease* in all studies, and VE was $\geq 70\%$ in 37 (88%) of 42 estimates evaluating VE between 14 days and three months of receipt of a booster dose (39 estimates evaluated an mRNA booster, two evaluated a Janssen-Ad26.COVID.2.S booster, and one evaluated a Sinovac-CoronaVac booster); one Moderna-Spikevax booster dose had VE $< 50\%$ (though confidence intervals were very wide), and one Janssen-Ad26.COVID.2.S booster dose had VE $< 70\%$. At three to six months post mRNA booster, VE was $\geq 70\%$ for 26 of 31 (84%) estimates (the primary series was an mRNA vaccine in 21 of the 29 estimates, AstraZeneca-Vaxzevria in eight and Sinovac-CoronaVac in two). One study found the VE to be $< 70\%$ but $\geq 50\%$ following three to six months from the third dose of Sinovac-CoronaVac.

Of note, a study from South Africa provided the first published evidence of vaccine effectiveness against hospitalization with Omicron BA.4/BA.5 sub-lineages.³⁶ The authors assessed VE Pfizer BioNTech-Comirnaty against hospitalization due to Omicron among adults and found similar magnitude of VE, as well as patterns of decreasing effectiveness over time for Omicron BA.4/BA.5 and Omicron BA.1/BA.2 for both the primary series and first booster dose of Pfizer BioNTech-Comirnaty.

VE against *symptomatic disease* and *infection* within the first three months of primary series vaccination was lower than against severe disease, and VE decreased more rapidly over time. For *symptomatic disease*, only four of 18 (22%) VE estimates for the mRNA vaccines were $\geq 70\%$ and only 10 (56%) were $\geq 50\%$; one (25%) of the four VE estimates for AstraZeneca-Vaxzevria was $\geq 70\%$ while the remaining three estimates were $< 50\%$; the single estimate for Janssen-Ad26.COVID.2.S was $\geq 70\%$, and all three estimates for Sinovac (CoronaVac) were $< 50\%$. Beyond three months after vaccination, only one of 40 (3%) VE estimates was $\geq 50\%$ (30 estimates evaluated mRNA vaccines, eight evaluated AstraZeneca-Vaxzevria, and two evaluated Sinovac-CoronaVac). An mRNA booster vaccination after completion of a primary series of an mRNA vaccine, AstraZeneca-Vaxzevria, or Sinovac-CoronaVac improved VE against *symptomatic disease*: seven of 25 (28%) VE estimates between 14 days and three months post booster were $\geq 70\%$, although 20 (80%) were $\geq 50\%$; one (50%) of two VE estimates evaluating three doses of AstraZeneca-Vaxzevria was $\geq 50\%$ but $< 70\%$. First booster dose protection declined rapidly over time: only four of 16 (25%) estimates available at three to six months following receipt of an mRNA booster dose had VE $\geq 50\%$ and none were $\geq 70\%$. Neither the single VE estimate for three doses of AstraZeneca-Vaxzevria nor the single estimate for three doses of Sinovac-CoronaVac that were assessed three to six months post booster vaccination was above 50%. VE against *infection* showed a similar pattern of steep waning as that against *symptomatic disease*.

Figure 6. Relative vaccine effectiveness of second booster vaccination against Omicron (relative to first booster vaccination)

Abbreviations: LTCF=long-term care facility; HCW=healthcare workers. Dots represent point estimates of vaccine effectiveness; horizontal lines represent the 95% confidence intervals. Labels along left side of plot indicate reference numbers, country, and study population. Reference numbers identify the study and link to the [summary table](https://view-hub.org) of VE effectiveness studies on view-hub.org (Table 2 in summary table). Severe disease includes any hospitalization and hospitalization with severe illness; symptomatic disease includes disease of any severity level; any infection can include symptomatic and asymptomatic infection.

Interpretation of the results of absolute VE and relative VE for the Omicron variant for second booster dose vaccination

Two studies have evaluated *absolute* VE of two booster doses (i.e. four total doses) of mRNA vaccines, comparing infection and disease events among persons receiving four doses to an unvaccinated comparison group. One second booster dose study among a high-risk population of long-term care facility residents in Canada reported VE for various combinations of mRNA vaccines of 49-52%, 59-73%, and 83-88% against Omicron infection, symptomatic disease, and hospitalization, respectively, with a maximum potential follow-up time post second booster dose of four months.⁴¹ The second study assessed VE of four doses of any combination of Pfizer BioNTech-Comirnaty and

Moderna-mRNA-1273 in persons 50 years and older in the United States, reporting VE estimates of 66% (95% CI: 60-71%) and 80% (95% CI-71-85%) against emergency department/urgent care visits and hospitalization due to Omicron, respectively, within the first two months of receipt of the second booster dose.⁴²

To date, 11 studies (see Figure 6), conducted among long-term care facility residents, older adults, and healthcare workers, have assessed *relative VE* of four doses of mRNA vaccines, by comparing the risk of Omicron infection, disease, and death among persons receiving four doses to persons having received three doses (i.e., first booster) of mRNA vaccines at least three to four months prior. For all outcomes, a fourth dose achieved marginal gains in VE compared to three doses (Figure 6). Relative VE of four doses of mRNA vaccine was higher for severe disease and death than for symptomatic disease and infection.

It is important to note that interpretation of relative VE is not straightforward; it cannot be translated into absolute VE or cases prevented after a second booster dose. Moreover, relative VE cannot be compared across studies due to differences in the absolute VE (which is often not reported) and epidemiological context of the setting of each study. In addition, the follow-up time after the fourth dose in most studies was short (ranging from one to four months) so that waning of the fourth dose is not evaluable. For more information on interpreting relative VE, see the special focus on relative vaccine effectiveness from the [June 29th Weekly Epidemiological Update](#).

WHO regional overviews:

Epidemiological week 12 - 18 September 2022**

African Region

The African Region reported over 6800 new weekly cases, a 35% decrease as compared to the previous week. Four (8%) countries reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases seen in the Seychelles (183 vs 94 new cases; +95%), Burundi (358 vs 229 new cases; +56%) and Togo (128 vs 100 new cases; +28%). The highest numbers of new cases were reported from Réunion (2572 new cases; 287.3 new cases per 100 000 population; -45%), South Africa (1603 new cases; 2.7 new cases per 100 000; -11%) and Nigeria (483 new cases; <1 new case per 100 000; -17%).

The number of new weekly deaths in the Region increased by 27% as compared to the previous week, with 44 deaths reported. The highest numbers of new deaths were reported from the Democratic Republic of the Congo (18 new deaths; <1 new death per 100 000 population; similar to the previous week), South Africa (17 new deaths; <1 new death per 100 000; -19%) and Réunion (five new deaths; <1 new death per 100 000; similar to the previous week).

Updates from the [African Region](#)

Region of the Americas

The Region of the Americas reported over 552 000 new cases, a 12% decrease as compared to the previous week. Eight of 56 (14%) countries for which data are available reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases observed in Honduras (825 vs 232 new cases; +256%), Belize (252 vs 102 new cases; +147%) and Ecuador (2012 vs 1417 new cases; +42%). The highest numbers of new cases were reported from the United States of America (395 117 new cases; 119.4 new cases per 100 000; -11%), Brazil (62 346 new cases; 29.3 new cases per 100 000; similar to the previous week) and Chile (23 853 new cases; 124.8 new cases per 100 000; -26%).

The number of new weekly deaths reported in the Region decreased by 5% as compared to the previous week, with over 4000 new deaths reported. The highest numbers of new deaths were reported from the United States of America (2601 new deaths; <1 new death per 100 000; +5%), Brazil (487 new deaths; <1 new death per 100 000; -12%) and Canada (245 new deaths; <1 new death per 100 000; similar to the previous week).

Updates from the [Region of the Americas](#)

Eastern Mediterranean Region

The Eastern Mediterranean Region reported over 23 000 new cases, a 14% decrease as compared to the previous week. Two (9%) countries reported increases in new cases of 20% or greater, with the highest proportional increase observed in Bahrain (2048 vs 1448 new cases; +41%). The highest numbers of new cases were reported from Qatar (5388 new cases; 187.0 new cases per 100 000; +27%), the Islamic Republic of Iran (4105 new cases; 4.9 new cases per 100 000; -47%) and Jordan (3389 new cases; 33.2 new cases per 100 000; similar to the previous week).

The number of new weekly deaths decreased in the Region by 46% as compared to the previous week, with over 100 new deaths reported. The highest numbers of new deaths were reported from the Islamic Republic of Iran (119 new deaths; <1 new death per 100 000; -54%), Saudi Arabia (15 new deaths; <1 new death per 100 000; +15%) and Lebanon (12 new deaths; <1 new death per 100 000; +33%).

Updates from the [Eastern Mediterranean Region](#)

European Region

In the European Region, the number of new weekly cases remained stable this week as compared to the previous week, with over 1.1 million new cases reported. Nine (15%) countries reported increases in new cases of 20% or greater, with the highest proportional increases observed in Monaco (62 vs 33 new cases; +88%) and Lithuania (8809 vs 5754 new cases; +53%). The highest numbers of new cases were reported from the Russian Federation (372 485 new cases; 255.2 new cases per 100 000; +10%), Germany (206 617 new cases; 248.4 new cases per 100 000; similar to the previous week) and France (183 271 new cases; 281.8 new cases per 100 000; +62%).

Over 2700 new weekly deaths were reported in the Region, a 22% decrease as compared to the previous week. The highest numbers of new deaths were reported from the Russian Federation (697 new deaths; <1 new death per 100 000; +9%), Spain (595 new deaths; 1.3 new deaths per 100 000; +83%) and Italy (371 new deaths; <1 new death per 100 000; similar to the previous week).

Updates from the [European Region](#)

South-East Asia Region

The South-East Asia Region reported over 66 000 new cases, an 8% decrease as compared to the previous week. Three of the 10 countries (30%) in the Region for which data are available showed an increase in the number of new cases of 20% or greater: Bhutan (311 vs 186 new cases; +67%), Myanmar (2046 vs 1293 new cases; +58%), and Bangladesh (2727 vs 2126; +28%). The highest numbers of new cases were reported from India (38 829 new cases; 2.8 new cases per 100 000; similar to the previous week), Indonesia (16 314 new cases; 6.0 new cases per 100 000; -18%) and Thailand (5841 new cases; 8.4 new cases per 100 000; -35%).

The Region reported over 400 deaths, a 6% decrease as compared to the previous week. The highest numbers of new deaths were reported from India (187 new deaths; <1 new death per 100 000; +18%), Indonesia (122 new deaths; <1 new death per 100 000; similar to the previous week) and Thailand (90 new deaths; <1 new death per 100 000; -35%).

Updates from the [South-East Asia Region](#)

Western Pacific Region

The Western Pacific Region reported a similar case count as the previous week, with over 1.4 million new cases. Four (12%) countries reported increases in new cases of 20% or greater, with the largest proportional increases observed in Marshall Islands (141 vs nine new cases; +1467%), New Caledonia (97 vs 23 new cases; +322%) and Vanuatu (51 vs 36 new cases; +42%). The highest numbers of new cases were reported from Japan (605 919 new cases; 479.1 new cases per 100 000; +13%), the Republic of Korea (389 579 new cases; 759.9 new cases per 100 000; -11%) and China (297 693 new cases; 20.2 new cases per 100 000; +13%).

The Region reported a 27% decrease in new weekly deaths as compared to the previous week, with over 2400 deaths reported. The highest numbers of new deaths were reported from Japan (1162 new deaths; 1 new death per 100 000; -31%), the Republic of Korea (377 new deaths; 1 new death per 100 000; +5%) and China (360 new deaths; <1 new death per 100 000; +20%).

Updates from the [Western Pacific Region](#)

Annex 1. Data, table, and figure notes

Data presented are based on official laboratory-confirmed COVID-19 cases and deaths reported to WHO by country/territories/areas, largely based upon WHO [case definitions](#) and [surveillance guidance](#). While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change, and caution must be taken when interpreting these data as several factors influence the counts presented, with variable underestimation of true case and death incidences, and variable delays to reflecting these data at the global level. Case detection, inclusion criteria, testing strategies, reporting practices, and data cut-off and lag times differ between countries/territories/areas. A small number of countries/territories/areas report combined probable and laboratory-confirmed cases. Differences are to be expected between information products published by WHO, national public health authorities, and other sources.

A record of historic data adjustment made is available upon request by emailing epi-data-support@who.int. Please specify the countries of interest, time period, and purpose of the request/intended usage. Prior situation reports will not be edited; see covid19.who.int for the most up-to-date data. COVID-19 confirmed cases and deaths reported in the last seven days by countries, territories, and areas, and WHO Region (reported in previous issues) are now available at: <https://covid19.who.int/table>.

‘Countries’ may refer to countries, territories, areas or other jurisdictions of similar status. The designations employed, and the presentation of these materials do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement. Countries, territories, and areas are arranged under the administering WHO region. The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions except, the names of proprietary products are distinguished by initial capital letters.

^[1] All references to Kosovo should be understood to be in the context of the United Nations Security Council resolution 1244 (1999). In the map, the number of cases of Serbia and Kosovo (UNSCR 1244, 1999) have been aggregated for visualization purposes.

^[2] A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Updates on the COVID-19 outbreak in the Democratic People’s Republic of Korea is not included in this report as the number of laboratory-confirmed COVID-19 cases is not reported.

Annex 2. SARS-CoV-2 variants assessment and classification

WHO, in collaboration with national authorities, institutions and researchers, routinely assesses if variants of SARS-CoV-2 alter transmission or disease characteristics, or impact the effectiveness of vaccines, therapeutics, diagnostics or public health and social measures (PHSM) applied to control disease spread. Potential variants of concern (VOCs), variants of interest (VOIs) or variants under monitoring (VUMs) are regularly assessed based on the risk posed to global public health.

The classifications of variants will be revised as needed to reflect the continuous evolution of circulating variants and their changing epidemiology. Criteria for variant classification, and the lists of currently circulating and previously circulating VOCs, VOIs and VUMs, are available on the [WHO Tracking SARS-CoV-2 variants website](#). National authorities may choose to designate other variants and are strongly encouraged to investigate and report newly emerging variants and their impact.

Annex 3. Summary of results of neutralization studies assessing primary series and booster vaccine performance against Omicron variant of concern (data updated 19 September 2022)

Abbreviations: HNR=high non-response. Arrows generalize the magnitude of reduction in VE or neutralization: “↔” indicates <2-fold reduction in neutralization relative to the ancestral strain; “↓” indicates 2 to <5-fold reduction; “↓↓” indicates 5 to <10-fold reduction; “↓↓↓” indicates ≥10-fold reduction. When more than one neutralization study is available, the interquartile range (25th and 75th percentiles) of fold-reductions across all studies for specific vaccine/sub-lineage was used. HNR indicates a median percent response across all studies of <75%; in these instances, fold-reductions can be biased and, thus, are not presented. The number of studies is shown as subscripts.

Additional notes on Annex Table 3

- Studies contributing to the table are identified from an ongoing review of the preprint and published literature on neutralization of SARS-CoV-2 variants by COVID-19 vaccines.
- The following sets of results are excluded from the table:
 - Samples collected <7 days or ≥6 months after final dose
 - Strain other than ancestral SARS-CoV-1 strain used as the reference
 - Samples collected from immunocompromised persons
 - More than 20% of samples collected from persons previously infected with SARS-CoV-2
- It is important to note that studies vary in population and other methodological considerations which may in part explain some differences when comparing products between different studies. In addition, the reductions summarized in the table do not incorporate uncertainty intervals around the fold reductions which can vary substantially across studies when reported.

Annex 4. Methods for Figure 5

- VE studies included in the plot were identified from an ongoing systematic review of COVID-19 vaccine effectiveness studies. All studies were cohort or test-negative designs conducted when Omicron was the predominant circulating variant. Methods for the systematic review and inclusion/exclusion criteria are available on view-hub.org.
- Only studies providing VE estimates of individual vaccines are included in the plot; studies assessing combined VE of more than one vaccine are excluded except for studies of heterologous primary and booster schedules where all participants included in a VE estimate received the same brands of vaccines in the same order.
- Only studies providing VE estimates for discrete time intervals since vaccination or estimates with limited follow-up time (such that the median time point falls clearly in one of the intervals for the plot) are included. Studies that only provide VE estimates over a cumulative period of time covering more than one-time interval are excluded because they are difficult to interpret due to the marked waning of VE over time with Omicron.
- Only estimates of absolute vaccine effectiveness (i.e., the comparison group is unvaccinated persons) are included in the plot; estimates of relative vaccine effectiveness (e.g., the comparison group is persons having completed the primary series) are excluded as the interpretation of relative vaccine effectiveness is not comparable with absolute vaccine effectiveness.

COVID-19 Weekly Epidemiological Update

Edition 111 published 28 September 2022

In this edition:

- [Global overview](#)
- [Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern](#)
- [WHO regional overviews](#)

Global overview

Data as of 25 September 2022

Globally, the number of new weekly cases decreased by 11% during the week of 19 to 25 September 2022 as compared to the previous week, with over three million new cases reported (Figure 1, Table 1). The number of new weekly deaths decreased by 18% as compared to the previous week, with just over 8900 fatalities reported. As of 25 September 2022, over 612 million confirmed cases and over 6.5 million deaths have been reported globally.

At the regional level, the number of newly reported weekly cases decreased or remained stable across all six WHO regions: the African Region (-33%), the Western Pacific Region (-19%), the Region of the Americas (-15%), South-East Asia Region (-11%), the Eastern Mediterranean Region (-8%) and the European Region (-1%). The number of new weekly deaths also decreased or remained stable across all six regions: the African Region (-34%), the Eastern Mediterranean Region (-26%), the European Region (-26%), the Western Pacific Region (-16%), the Region of the Americas (-12%) and the South-East Asia Region (-3%).

Figure 1. COVID-19 cases reported weekly by WHO Region, and global deaths, as of 25 September 2022**

**See [Annex 1: Data, table, and figure notes](#)

At the country level, the highest numbers of new weekly cases were reported from Japan (535 502 new cases; -12%), the United States of America (361 599 new cases; -11%), the Russian Federation (353 826 new cases; -5%), China (292 476 new cases; similar to the previous week) and Germany (249 144 new cases; +9%). The highest numbers of new weekly deaths were reported from the United States of America (2484 new deaths; -11%), the Russian Federation (712 new deaths; similar to the previous week), Japan (659 new deaths; -43%), China (497 new deaths; +38%) and Brazil (450 new deaths; -8%).

Current trends in reported COVID-19 cases and deaths should be interpreted with caution as several countries have been progressively changing COVID-19 testing strategies, resulting in lower overall numbers of tests performed and consequently lower numbers of cases detected. Additionally, data from previous weeks are continuously updated to retrospectively incorporate changes in reported COVID-19 cases and deaths made by countries.

Table 1. Newly reported and cumulative COVID-19 confirmed cases and deaths, by WHO Region, as of 25 September 2022**

WHO Region	New cases in last 7 days (%)	Change in new cases in last 7 days *	Cumulative cases (%)	New deaths in last 7 days (%)	Change in new deaths in last 7 days *	Cumulative deaths (%)
Europe	1 286 716 (43%)	-1%	252 484 657 (41%)	2 533 (28%)	-26%	2 091 574 (32%)
Western Pacific	1 146 241 (38%)	-19%	89 132 222 (15%)	2 043 (23%)	-16%	269 650 (4%)
Americas	485 131 (16%)	-15%	177 970 746 (29%)	3 744 (42%)	-12%	2 834 637 (44%)
South-East Asia	59 693 (2%)	-11%	60 252 396 (10%)	416 (5%)	-3%	797 289 (12%)
Eastern Mediterranean	21 818 (1%)	-8%	23 068 037 (4%)	128 (1%)	-26%	348 277 (5%)
Africa	5 742 (<1%)	-33%	9 325 369 (2%)	37 (<1%)	-34%	174 507 (3%)
Global	3 005 341 (100%)	-11%	612 234 191 (100%)	8 901 (100%)	-18%	6 515 947 (100%)

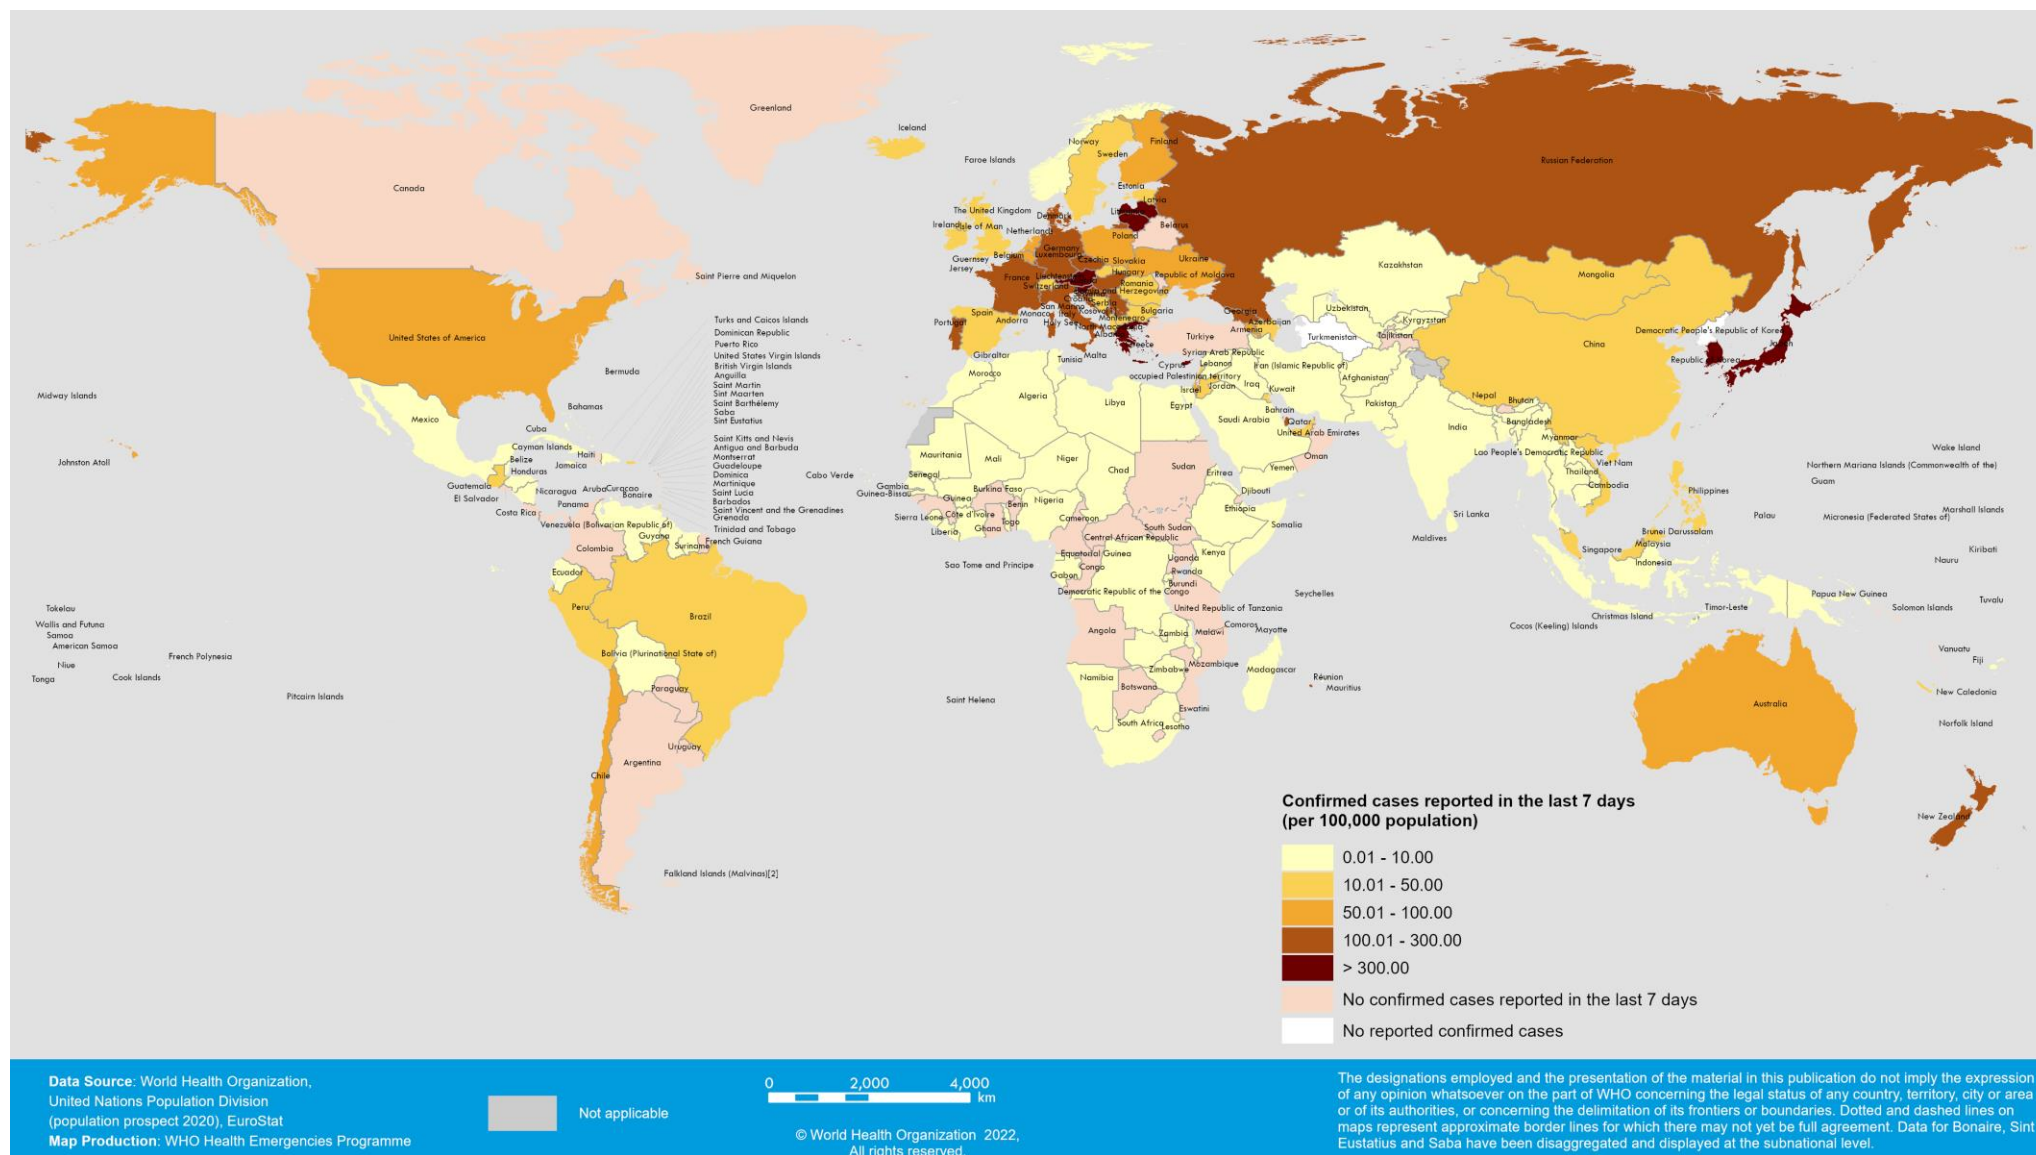

*Percent change in the number of newly confirmed cases/deaths in the past seven days, compared to seven days prior. Data from previous weeks are updated continuously with adjustments received from countries.

Special Focus: Update on SARS-CoV-2 variants of interest and variants of concern

Geographic spread and prevalence of VOCs

Globally, from 26 August to 26 September 2022, 106 735 SARS-CoV-2 sequences were shared through GISAID. Among these, 106 686 sequences were the Omicron variant of concern (VOC), accounting for 99.9% of sequences reported globally in the past 30 days.

There continues to be increased diversity within Omicron and within its descendent lineages. A number of these Omicron descendent lineages are under monitoringⁱ. Globally, and as of the epidemiological week 36 (5 to 11 September 2022), BA.5 descendent lineages continue to be dominant accounting for 81.2% of sequences, followed by BA.4 descendent lineages (including BA.4.6) which account for 8.1%, and BA.2 descendent lineages (including BA.2.75) which account for 2.9% of sequences. During the reporting week (5 to 11 September), unassigned sequences (presumed to be Omicron) account for 7.8% of sequences submitted to GISAID.

For more information on the assessment of SARS-CoV-2 variants and the WHO classification, refer to Annex 2.

WHO regional overviews:

Epidemiological week 19 - 25 September 2022**

African Region

The African Region reported over 5700 new weekly cases, a 33% decrease as compared to the previous week. Eight (16%) countries reported increases in the number of new cases of 20% or greater, with some of the greatest proportional increases seen in Zimbabwe (344 vs 126 new cases; +173%), Togo (196 vs 128 new cases; +53%) and Kenya (57 vs 42 new cases; +36%). The highest numbers of new cases were reported from Saint Helena (1357 new cases; 22 352.2 new cases per 100 000 population; +1867%), Réunion (1325 new cases; 148.0 new cases per 100 000; -48%) and South Africa (1283 new cases; 2.2 new cases per 100 000; -20%).

The number of new weekly deaths in the Region decreased by 34% as compared to the previous week, with 37 deaths reported. The highest numbers of new deaths were reported from South Africa (23 new deaths; <1 new death per 100 000 population; +35%), Réunion (eight new deaths; <1 new death per 100 000; +60%) and Mali (two new deaths; <1 new death per 100 000; no cases reported during the previous week).

Updates from the [African Region](#)

Region of the Americas

The Region of the Americas reported over 485 000 new cases, a 15% decrease as compared to the previous week. One of the 56 (2%) countries for which data are available reported an increase in the number of new cases of 20% or greater: Antigua and Barbuda (81 vs 34 new cases; +138%). The highest numbers of new cases were reported from the United States of America (361 599 new cases; 109.2 new cases per 100 000; -11%), Brazil (45 342 new cases; 21.3 new cases per 100 000; -27%) and Chile (19 860 new cases; 103.9 new cases per 100 000; -17%).

The number of new weekly deaths reported in the Region decreased by 12% as compared to the previous week, with over 3700 new deaths reported. The highest numbers of new deaths were reported from the United States of America (2484 new deaths; <1 new death per 100 000; -11%), Brazil (450 new deaths; <1 new death per 100 000; -8%) and Canada (195 new deaths; <1 new death per 100 000; -22%).

Updates from the [Region of the Americas](#)

Eastern Mediterranean Region

The Eastern Mediterranean Region reported over 21 000 new cases, an 8% decrease as compared to the previous week. One (5%) country reported an increase in new cases of 20% or greater: Bahrain (2539 vs 2048 new cases; +24%). The highest numbers of new cases were reported from Qatar (5697 new cases; 197.7 new cases per 100 000; +6%), the Islamic Republic of Iran (3121 new cases; 3.7 new cases per 100 000; -24%) and Jordan (2776 new cases; 27.2 new cases per 100 000; -18%).

The number of new weekly deaths decreased in the Region by 26% as compared to the previous week, with over 100 new deaths reported. The highest numbers of new deaths were reported from the Islamic Republic of Iran (85 new deaths; <1 new death per 100 000; -29%), Lebanon (13 new deaths; <1 new death per 100 000; +8%) and Saudi Arabia (11 new deaths; <1 new death per 100 000; -27%).

Updates from the [Eastern Mediterranean Region](#)

European Region

In the European Region, the number of new weekly cases remained stable this week as compared to the previous week, with over 1.2 million new cases reported. Five (8%) countries reported increases in new cases of 20% or greater, with the highest proportional increases observed in San Marino (102 vs 66 new cases; +55%), Ukraine (36 683 vs 23 864 new cases; +54%) and Austria (47 812 vs 33 909 new cases; +41%). The highest numbers of new cases were reported from the Russian Federation (353 826 new cases; 242.5 new cases per 100 000; -5%), Germany (249 144 new cases; 299.6 new cases per 100 000; +9%) and France (191 463 new cases; 294.4 new cases per 100 000; similar to the previous week).

Over 2500 new weekly deaths were reported in the Region, a 26% decrease as compared to the previous week. The highest numbers of new deaths were reported from the Russian Federation (712 new deaths; <1 new death per 100 000; similar to the previous week), Italy (321 new deaths; <1 new death per 100 000; -13%) and Spain (284 new deaths; <1 new death per 100 000; -52%).

Updates from the [European Region](#)

South-East Asia Region

The South-East Asia Region reported over 59 000 new cases, an 11% decrease as compared to the previous week. Two of the 10 countries (20%) in the Region for which data are available showed an increase in the number of new cases of 20% or greater: Bangladesh (4076 vs 2727 new cases; +49%) and Myanmar (2504 vs 2046 new cases; +22%). The highest numbers of new cases were reported from India (33 926 new cases; 2.5 new cases per 100 000; -13%), Indonesia (13 723 new cases; 5.0 new cases per 100 000; -16%) and Thailand (4965 new cases; 7.1 new cases per 100 000; -15%).

The Region reported over 400 deaths, similar to the previous week. The highest numbers of new deaths were reported from India (173 new deaths; <1 new death per 100 000; -7%), Indonesia (122 new deaths; <1 new death per 100 000; similar to the previous week) and Thailand (89 new deaths; <1 new death per 100 000; similar to the previous week).

Updates from the [South-East Asia Region](#)

Western Pacific Region

The Western Pacific Region reported over 1.1 million new cases, a 19% decrease compared to the previous week. Five (15%) countries reported increases in new cases of 20% or greater, with some of the largest proportional increases observed in New Zealand (12 957 vs 3178 new cases; +308%), Papua New Guinea (44 vs 25 new cases; +76%) and the Philippines (16 357 vs 12 069 new cases; +36%). The highest numbers of new cases were reported from Japan (535 502 new cases; 423.4 new cases per 100 000; -12%), China (292 476 new cases; 19.9 new cases per 100 000; similar to the previous week) and the Republic of Korea (225 662 new cases; 440.2 new cases per 100 000; -42%).

The Region reported a 16% decrease in new weekly deaths as compared to the previous week, with over 2000 deaths reported. The highest numbers of new deaths were reported from Japan (659 new deaths; <1 new death per 100 000; -43%), China (497 new deaths; <1 new death per 100 000; +38%) and the Republic of Korea (385 new deaths; <1 new death per 100 000; similar to the previous week).

Updates from the [Western Pacific Region](#)

Annex 1. Data, table, and figure notes

Data presented are based on official laboratory-confirmed COVID-19 cases and deaths reported to WHO by country/territories/areas, largely based upon WHO [case definitions](#) and [surveillance guidance](#). While steps are taken to ensure accuracy and reliability, all data are subject to continuous verification and change, and caution must be taken when interpreting these data as several factors influence the counts presented, with variable underestimation of true case and death incidences, and variable delays to reflecting these data at the global level. Case detection, inclusion criteria, testing strategies, reporting practices, and data cut-off and lag times differ between countries/territories/areas. A small number of countries/territories/areas report combined probable and laboratory-confirmed cases. Differences are to be expected between information products published by WHO, national public health authorities, and other sources.

A record of historic data adjustment made is available upon request by emailing epi-data-support@who.int. Please specify the countries of interest, time period, and purpose of the request/intended usage. Prior situation reports will not be edited; see covid19.who.int for the most up-to-date data. COVID-19 confirmed cases and deaths reported in the last seven days by countries, territories, and areas, and WHO Region (reported in previous issues) are now available at: <https://covid19.who.int/table>.

‘Countries’ may refer to countries, territories, areas or other jurisdictions of similar status. The designations employed, and the presentation of these materials do not imply the expression of any opinion whatsoever on the part of WHO concerning the legal status of any country, territory, or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted and dashed lines on maps represent approximate border lines for which there may not yet be full agreement. Countries, territories, and areas are arranged under the administering WHO region. The mention of specific companies or of certain manufacturers’ products does not imply that they are endorsed or recommended by WHO in preference to others of a similar nature that are not mentioned. Errors and omissions except, the names of proprietary products are distinguished by initial capital letters.

^[1] All references to Kosovo should be understood to be in the context of the United Nations Security Council resolution 1244 (1999). In the map, the number of cases of Serbia and Kosovo (UNSCR 1244, 1999) have been aggregated for visualization purposes.

^[2] A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Updates on the COVID-19 outbreak in the Democratic People’s Republic of Korea is not included in this report as the number of laboratory-confirmed COVID-19 cases is not reported.

Annex 2. SARS-CoV-2 variants assessment and classification

WHO, in collaboration with national authorities, institutions and researchers, routinely assesses if variants of SARS-CoV-2 alter transmission or disease characteristics, or impact the effectiveness of vaccines, therapeutics, diagnostics or public health and social measures (PHSM) applied to control disease spread. Potential variants of concern (VOCs), variants of interest (VOIs) or variants under monitoring (VUMs) are regularly assessed based on the risk posed to global public health.

The classifications of variants will be revised as needed to reflect the continuous evolution of circulating variants and their changing epidemiology. Criteria for variant classification, and the lists of currently circulating and previously circulating VOCs, VOIs and VUMs, are available on the [WHO Tracking SARS-CoV-2 variants website](#). National authorities may choose to designate other variants and are strongly encouraged to investigate and report newly emerging variants and their impact.

WHO continues to monitor SARS-CoV-2 variants, including descendent lineages of VOCs, to track changes in prevalence and viral characteristics. The current trends describing the circulation of Omicron descendent lineages should be interpreted with due consideration of the limitations of the COVID-19 surveillance systems. These include differences in sequencing capacity and sampling strategies between countries, changes in sampling strategies over time, reductions in tests conducted and sequences shared by countries, and delays in uploading sequence data to GISAID.
