

COVID Cases and Sero Survey Status

Posted On: 18 SEP 2020 4:20PM by PIB Delhi

India has one of the lowest cases per million population. It is 3445 for India as compared to 19295 for USA, 20146 for Brazil, 7283 for Russian Federation and 10929 for South Africa. However, cases per million population for India is high as compared to other countries in South East Asia

The low case fatality in India can be attributed to early case detection through community-based surveillance, containment measures including strict perimeter control, house-to-house case search & follow-up with monitoring of oxygen saturation, early referral to COVID treatment facilities and adequate case management.

The Minister of State (Health and Family Welfare), Sh Ashwini Kumar Choubey stated this in a written reply in the Lok Sabha here today.
